1 Introduction 1
1.1 Why is genetics relevant for me? 4

2 Nature, nurture, and heritability 7
2.1 Phenotype, genotype and environment 7
2.2 Innateness, a slippery and complex concept 9
2.3 Some basic notions of statistics 12
2.3.1 Mean, variance and standard deviation 14
2.3.2 The normal distribution 15
2.3.3 Statistical populations and samples 19
2.3.4 Covariance and correlation 21
2.3.5 Regression 24
2.4 Basic notions of quantitative genetics 30
2.4.1 Partitioning the phenotype and broad-sense heritability, H^2 31
2.4.2 Partitioning the genotype and narrow-sense heritability, h^2 32
2.4.3 Partitioning the environment 33
2.4.4 Estimating heritability 34
2.4.5 Heritability: what it does and does not mean 37
2.4.6 The heritability of language and speech 39
2.4.7 Relationships between genotype and environment 40
2.4.8 Sharing genes between phenotypes: genetic correlations and "generalist genes" 42

3 The molecular bases of genetics 44
3.1 We are composed of cells 45
3.2 The molecules of life 48

3.3 The genetic material 49
3.4 DNA: storing and transmitting information 50
3.5 Chromosomes are DNA molecules 53
3.6 Genetic loci and recombination 58
3.7 What is a gene? 59
3.7.1 Decoding genes: transcription and translation 61
3.7.2 Genes have structure: introns and exons 68

4 Effects of genes on phenotype 72
4.1 Dominance and recessiveness 72
4.2 Autosomal dominance and recessiveness 75
4.2.1 A dominant speech and language disorder 75
4.2.2 Recessive hearing loss 80
4.3 Sex-linked dominance and recessiveness 83
4.3.1 X chromosome inactivation 84
4.3.2 Anomalous colour perception 84
4.3.3 Variation in colour perception and language 88

5 Linkage disequilibrium and its role in finding genes 90
5.1 What is linkage disequilibrium? 90
5.2 Using linkage disequilibrium 93
5.3 Association studies 94
5.3.1 Statistical concepts: power, multiple testing correction and effect size 97
5.3.2 Controlling for other factors using regression 110
5.3.3 Accounting for population stratification 113
5.3.4 Replication as the gold standard 115
5.3.5 Combining multiple markers 116
5.3.6 The Transmission Disequilibrium Test 118
5.3.7 Examples of association studies for language and speech 120
5.4 Linkage studies 124

6 What do genes actually do? 131
6.1 Structural proteins: *TECTA* in the inner ear 131
6.2 Energy production: mitochondrial gene *MTRNR1* 133
6.3 The transportation system: *MYO15A* 134
6.4 Unexpected processes: stuttering and the lysosome 135
6.5 Guiding axons: *ROBO1* in dyslexia and normal variation 137
6.6 Brain growth and development: *ASPM* and *MCHP1* 139
6.7 Regulating the expression of other genes: *FOXP2* 142
6.8 Neural development and neural impulse conduction: *CNTNAP2* 149

6.9 Post-transcriptional gene regulation: microRNAs 151
6.9.1 microRNAs and *FOXP2* 151
6.9.2 *miR-96* and hearing loss 152

7 The way forward: exome and genome sequencing 153
7.1 Exome and genome sequencing 153
7.2 The "missing heritability" and the genetic architecture of complex traits 155

8 Population and evolutionary genetics 160
8.1 Foundations of population genetics: loci, alleles, individuals and populations 161
8.2 A useful baseline: the Hardy-Weinberg equilibrium 162
8.3 Genetic drift: the power of chance 164
8.4 Mutation: the creator of diversity 168
8.5 Selection: when differences do matter 170
8.5.1 Positive, stabilizing and disruptive selection 171
8.5.2 Hiking the fitness landscape 173
8.5.3 When selection seemingly fails 175
8.5.4 What is selected: de-focusing the individual 177
8.5.5 The (nearly) neutral theory of evolution 178
8.5.6 Detecting selection from genetic data 179
8.5.7 The evolutionary tale of *FOXP2* 185
8.6 Population structure: love is not blind 187
8.6.1 Inbreeding: mating among genetic relatives 187
8.6.2 (Dis-)assortative mating: choosing partners (un)like yourself 188
8.6.3 Structured populations: choosing the partners you can actually choose 188
8.6.4 The genetic structure of modern humans 190
8.7 Recent and ongoing evolution in humans 195
8.7.1 Skin colour 195
8.7.2 Hair, sweat and ear wax 196
8.7.3 Living at high altitude 197
8.7.4 Is culture shielding or selecting us? 198

9 Interactions between genetic and cultural evolution 199
9.1 Fighting pathogens 200
9.2 Eating well 202
9.3 Creating new languages 204
9.4 Genetically biased cultural evolution 207
9.4.1 Genetic biases in language 209

10 Conclusions, topics not covered, future directions 212
10.1 Resources for further study 213

Appendix **The computer code** 216
A.1 Simulating contingency tables 216
A.2 Log odds ratio 217
A.3 Simulating genetic drift 218
